## Where in the world do you find biomes?

Biomes are a large region of earth that has a certain climate and certain types of living things

Biomes are often divided into five basic types: aquatic, forest, desert, tundra, and grassland.

Each biome is located in different areas of the world

The climate of a biome plays a big part in the survival of living things.

Living things have to adapt to the biome which they are in, in order to survive.

Indigenous people have adapted their lives to support the environment they live in.

Grassland	a large area of land covered by grass.
Forests	a large area of land covered with many trees and other plants.
Aquatic	living or growing in or on water.
Environment	the things and conditions that are all around one.
